

Lamin's Printing Quality

Our goal was to visualise the great performance of both Lamin Printers. The print quality of both printers is the same. (only handling, speed and price vary on the two models)

Therefore we chose 2 different and "difficult to print" designs:

- pantone colors, color flows and in the middle a high resolution picture

Printed with Lamin 410

Professional color proof

Printed with Lamin 430

As you can see:

- the colors match in a best possible way with the proof on both models
- the colorflow comes out with no stops
- the picture is printed in a very bright and colorful way and does not vary* from the proof and our "wet in wet" technology allows to print bright, realistic and shiny as never before

Before you decide for a new printer you should definitely check out our quality:

- if you do not have yet an offset printer, you'll have best choice for quality and handling
- if you do have already other offset printers in your plant, you'll have a new unit that is easily able to do same prints for re-orders and best possible quality for new runs (this includes also the printers of the leading european manufacturers)

Contact us for further details, to get printing samples, printing files and its proofs. We are happy to help you comparing and supply all samples and detailinformation.

(*scanned the same way, so it might vary on above pictures as scanning CDs or Paper-proofs might give some differences - hi-resolution pictures under www.adivan.com/solutions/equipment/index.htm)
